

gb-starwars-characters-process-api

Summary

This project was to resolve the integration to be able to retrieve all of the characters from the Star Wars movies by making one single request.

Systems Involved

Swapi – To collect the characters information

Process

This integration was achieved by the use of the VM component to be able to do a pagination of the information found on the Swapi. As well the information received was stored to be processed later on API.

Finally, the HTTP Request validates if the query Param is present and with that returns a CSV information by gender.
